Can i configure the Spring MVC application so that when ever i run the application, the controller or any method should be called automatically

I have developed a spring application with rest controller which will have only one GET method. Can i configure the Spring MVC application so that when ever i run the application, the controller or any method should be called automatically with out hitting the api from browser(Just like stand alone application)

You can create a bean that implements `org.springframework.boot.CommandLineRunner` interface.

E.g.

8

1

```
@Component
```

2

```
public class MyRunner implements CommandLineRunner {
```

3

```
 @Override
```

4

```
    public void run(String... args) throws Exception {
```

5

```
        // Do stuff here at startup
```

6

```
    }
```

7

```
 }
```

8

As this is a regular Spring component, you can use field or constructor injection to inject other Spring components.
